

FogBugz service management

Deprecated

Creation of new service integrations has been deprecated in favor of Bitbucket Cloud's [webhooks](#), [Connect integration framework](#), and email [notifications](#).

With this service, you can integrate Bitbucket Cloud with [FogBugz](#), an issue-tracking and project-management system. If you are having trouble with the service, see [Troubleshoot Bitbucket Cloud services](#).

Setting Up the service

You must have administrative access on a repository to add this service.

1. Go to the repository's settings.
2. Click **Services** in the left-hand navigation.
The Services page appears.
3. Select the **FogBugz** service from the services dropdown.
4. Click **Add service**.
A new section appears for the **FogBugz** service.
5. Enter the following information:

Repository ID: Enter the ID of the FogBugz repository.

CVSSubmit URL: Enter the URL to which Bitbucket should send its update messages. Do not specify any URL parameters, for example: `https://your_repo.fogbugz.com/cvsSubmit.asp`

6. Press **Save**.

Using the FogBugz in Your Commit Comment

When you create a commit message, put a mention of the BugzID string in the message like this:

```
git commit -m "This is a superb commit which solves case BugzID: 42"
```
