

## Notify services about repo activities

You can configure Bitbucket Cloud to send a notification to another web service when your repository is updated. If you like, you can send the notification to a number of web services.

Bitbucket offers integration with external services by allowing a set of 'brokers' to run at certain events. These brokers are simple Python scripts that receive information about the event and take action. For example, there is a broker for sending email messages, another for posting information to an arbitrary URL, and another for posting updates to a Twitter account.

If you are a Bitbucket repository administrator, you can set up these services. See [Manage Bitbucket Cloud services](#).
