

# Email Diff service management

## Deprecated

Creation of new service integrations has been deprecated in favor of Bitbucket Cloud's [webhooks](#), [Connect integration framework](#), and email [notifications](#).

With this service, you can set up Bitbucket Cloud to send an email message to a given email address when the repository is updated. The email service sends an email with diffs. Currently, you can only forward to a single email address. If you are having trouble with the service, see [Troubleshoot Bitbucket Cloud services](#).

## Setting Up the service

You must have administrative access on a repository to add this service.

1. Go to the repository's settings.
2. Click **Services** in the left-hand navigation.  
The Services page appears.
3. Select the **Email Diff** service from the service dropdown.
4. Click **Add service**.  
A new section appears for the **Email Diff** service.
5. Enter the following information:  
**Email:** Enter the email address where Bitbucket should send the email messages.
6. Press **Save**.
