

Application Links Documentation

About Application Links

Application Links (AppLinks) is a plugin that allows you to link your [JIRA](#), [Confluence](#), [FishEye](#), [Crucible](#), [Bamboo](#) and [Subversion](#) applications. You can even choose to associate individual entities (i.e. JIRA projects, Confluence spaces, FishEye repositories, FishEye projects, Crucible projects, Bamboo projects) with each other. Application Links is bundled with FishEye 2.4 and will be bundled with Confluence 3.5 and JIRA 4.3.

Linking two applications allows you to share information and access one application's functions from within the other. For example, if you linked a JIRA server and a Confluence server, you could view JIRA issues in a Confluence page via the [JIRA Issues Macro](#).

Getting Started

The [Quick Start Guide](#) provides instructions on how to set up the most common application link configuration.

If you want to set up application links with a different configuration, see the [Administering Application Links](#).

Administrator's Guide

The administrator's guide is for administrators who want to configure application links for the applications. The guide contains information on [adding a new application link](#), [configuring the authentication](#) for an application link, [setting up entity links](#) and more.

Developer Resources

These resources are for developers who want to develop with the Application Links plugin. Take a look at the [Development Hub](#).
